42 1. Preamble

43
44 This document is inscribed in the framework of the International Medical Device Regulators
45 Forum (IMDRF). It replaces the "Guidance on a Unique Device Identification System (UDI) for
46 Medical Devices" adopted by the Global Harmonization Task Force (GHTF) on 16 September
47 2011.

48 The IMDRF Guidance on a "Unique Device Identification System (UDI) for Medical Devices"
49 clarifies and supplements the above mentioned GHTF Guidance by providing non-binding rules
50 for use in the regulation of medical devices, and has been subject to consultation throughout its
51 development.

52 There are no restrictions on the reproduction, distribution or use of this document; however,
53 incorporation of this document, in part or in whole, into any other document, or its translation
54 into languages other than English, does not convey or represent an endorsement of any kind by
55 the International Medical Device Regulators Forum.
56

57 2. Introduction

58
59 This guidance provides a framework for those regulatory authorities that intend to develop their
60 own UDI Systems – such that, when implemented, it achieves a globally harmonized approach to
61 UDI. It is expected that the regulatory authorities will follow the guidance when developing their
62 own UDI requirements. The framework can be used at a local, national, or global level. In order
63 to reach the goal of a globally harmonized UDI System, it is critical that these systems are
64 implemented **without** regional or national differences. This guidance is intended to provide a
65 high-level conceptual view of how a global UDI System should work. It is recognized that
66 further additional guidance may be needed once these core concepts are implemented.
67

68 The fundamental concepts of a globally harmonized UDI System include:

- 69
- 70 a. the UDI and UDI Carrier are based on global standards,
 - 71 b. a UDI applied to a medical device anywhere in the world should be able to be used
72 globally to meet the UDI requirements of any regulatory authority,
 - 73 c. national or local identification numbers should NOT be a substitute for UDI,
 - 74 d. regulatory Authorities should not specify how to modify these standards
 - 75 e. the UDI Database (UDID) core elements should not be modified,
 - 76 f. the UDID should use the HL7 SPL for data submission,
 - 77 g. each medical device needs to be identified by a UDI.
78

79 The UDI System is intended to provide a single, globally harmonized system for positive
80 identification of medical devices. Healthcare professionals and patients will no longer have to
81 access multiple, inconsistent, and incomplete sources in an attempt to identify a medical device
82 and, its key attributes. The UDID is a designated source for additional information. It is critical
83 to note that the benefits of UDI can only accrue if all stakeholders, from the manufacturer to
84 healthcare providers and patients, use UDI throughout their systems. Therefore, it is imperative
85 that all stakeholders be educated about the development and use of a UDI System.
86

87 A globally harmonized and consistent approach to UDI is expected to increase patient safety and
88 help optimize patient care by facilitating the:

- 89
- 90 a. traceability of medical devices, especially for recalls and other field safety corrective
 - 91 actions,
 - 92 b. adequate identification of medical devices through distribution and use,
 - 93 c. identification of medical devices in adverse events,
 - 94 d. reduction of medical errors,
 - 95 e. documenting and longitudinal capture of data on medical devices.
- 96

97 *2.1 Traceability*

98

99 The global use of a Unique Device Identifier (UDI) will facilitate traceability throughout
100 distribution.

101 In order to achieve traceability, it is necessary to require all stakeholders to capture and store the
102 UDI (Device Identifier + Production Identifier) throughout distribution and use.

103 This is especially important for recalls and other field safety corrective actions.

104 Though the UDI Database (UDID) does not capture Production Identifiers (UDI-PI), it is
105 expected that supply chain operators will capture and use these identifiers. This is critical during
106 recalls and other field safety corrective actions. In addition, the foundational use of UDI can help
107 fight counterfeiting and secure the supply chain for all stakeholders.

108 Traceability includes:

- 109
- 110 a. recording medical devices from manufacturer to healthcare provider throughout the
 - 111 supply chain,
 - 112 b. recording medical device use in patients,
 - 113 c. implementation of medical device recalls,
 - 114 d. a standardized way to input medical device identification into registries.
- 115

116 *2.2 Identification*

117

118 UDI will facilitate the adequate identification of the medical device through distribution and use
119 by providing a single global identifier that can be used to link and integrate existing government,
120 clinical, hospital, and industry databases. UDI should allow for improved procurement, inventory
121 management, and accounting. The existence of a single device identifier (UDI-DI) to link
122 disparate data bases should allow creative new medical and business applications, and synergy
123 among those applications.

124

125 *2.3 Adverse Event Reporting*

126

127 UDI will allow industry and regulatory authorities to more rapidly identify medical devices
128 involved in adverse events. UDI will be available for inclusion in adverse event reports, allowing
129 greater accuracy in reporting, and more rapid aggregation of related reports. Using this
130 information, Health Authorities can more rapidly collate and analyze problem reports and
131 identify the most-appropriate solution for a particular concern. UDI will allow more targeted

132 safety alerts, recalls, and other corrective actions on the specific medical devices that are of
133 concern.

134
135 *2.4 Medical Errors*

136
137 By providing rapid and electronic access to critical patient safety information relating to a
138 medical device, the UDI system may help clinicians more safely select and use the proper
139 medical device for a patient. UDID data could be downloaded by healthcare providers to be used
140 for internal reference of safety related information.

141
142 *2.5 Documentation*

143
144 The use of UDI System will facilitate and simplify the documentation of medical device use in
145 various patient records including traditional as well as electronic health records and registries.
146 UDI should also enable linkages of medical device information across various systems and
147 across geographies. These applications of UDI could help identifying medical device problems
148 and enhance comparative effectiveness.

149
150 Other considerations essential for the successful development and implementation of a globally
151 harmonized UDI System include:

- 152
- 153 a. a risk-based approach which is essential given the huge diversity of the medical devices,
 - 154 b. kits, systems and other groups of devices which need to be managed appropriately,
 - 155 c. requirements which should be phased in over a period of years based on risk classes,
156 starting with the highest risk class, to reduce the burden of implementation,
 - 157 d. the need for all supply chain stakeholders to have sufficient time to prepare their systems,
158 processes and staff, for the proper use of the UDI system.
- 159

160 **3. Rationale, purpose and scope**

161 *3.1 Rationale*

162
163
164 There are currently no global definitions of what constitutes a UDI or UDI System. As a
165 consequence, discrepancies between different national approaches do exist and will most likely
166 increase. Common globally harmonized UDI System requirements would offer significant
167 benefits to manufacturers, healthcare providers, patients, and regulatory authorities. In addition,
168 eliminating or reducing differences between regulatory authorities decreases the cost of gaining
169 regulatory compliance.

170 *3.2 Purpose*

171
172
173 A UDI unambiguously identifies a manufacturer's specific medical device. A standardized UDI
174 is part of the label, documented in the UDID, and used consistently throughout distribution and
175 use should facilitate a number of patient safety benefits, including:

- 176
- 177 a. traceability of medical devices,

- 178 b. the identification of medical devices in adverse events reports and other post-market
179 safety surveillance activities,
180 c. field safety corrective actions, including recalls,
181 d. the reduction of medical errors,
182 e. establishing and maintaining registries.
183

184 This guidance intends to avoid country-specific requirements regarding the core elements of the
185 UDI System by developing common guidance for:
186

- 187 a. creating, use and maintaining a UDI,
188 b. applying a UDI Carrier,
189 c. establishing the UDID model/structure, with a defined list of Data Elements,
190 d. establishing basic requirements for a data submission format based on a common
191 standard,
192 e. establishing basic requirements for a common data exchange standard.
193

194 In order to facilitate global traceability, the UDI System should be promoted and used at all
195 levels by all stakeholders, including regulatory authorities, medical device manufacturers,
196 distributors, healthcare providers and patients.
197

198 This document does not address the use of the UDI System, e.g. by healthcare providers.
199 Therefore it does not directly address issues associated with counterfeit medical devices or how
200 to enable better control of purchasing which will depend on the use of the UDI System by
201 healthcare providers.
202

203 3.3 Scope

204
205 This document applies to all products to be placed on the market that are regulated as medical
206 devices. For a definition of a medical device, see the GHTF document "*Information Document
207 Concerning the Definition of the Term "Medical Device"*".

208 This document is addressed to the regulatory authorities and affects medical device
209 manufacturers.
210

226

227 **5. Definitions**

228
229 *Accessory*

230 Accessory means an article intended specifically by its manufacturer to be used together with a
231 specific medical device(s), to enable the medical device to be used in accordance with its
232 intended use [modified draft GHTF definition –SG1 N071:2012].
233

234 *Automatic Identification and Data Capture (AIDC)*

235 AIDC refers to the methods for automatic identification of objects, collecting data about them,
236 and entering the data directly into computer systems.
237

238 *Configurable medical device system*

239 A configurable medical device system consists of several components which can be assembled in
240 multiple configurations. Those components may be medical devices itself and/or non-medical
241 devices.

242 Examples are Computed Tomography (CT) systems, Ultrasound systems, Anesthesia systems,
243 Physiological Monitoring systems, Radiology Information System (RIS).
244

245 *Configuration*

246 Configuration is a combination of items of equipment, as specified by the manufacturer, that
247 operate together to provide an intended use or purpose as a medical device. The combination of
248 items may be modified, adjusted or customized to meet a customer need.

249 Examples:

250 1. CT: gantry, tube, table, console are items of equipment that can be configured/combined to
251 deliver an intended function.

252 2. Anesthesia: ventilator, breathing circuit, vaporizer are items of equipment that can be
253 configured/combine to deliver an intended function.
254

255 *Device Identifier (UDI-DI)*

256 The UDI-DI is a unique numeric or alphanumeric code specific to a model of medical device and
257 that is also used as the "access key" to information stored in a UDID. Examples of the UDI-DI
258 include GS1 GTIN, HIBC-LIC, ISBT product code.
259

260 *Human Readable Interpretation (HRI)*

261 Human Readable Interpretation is a legible interpretation of the data characters encoded in the
262 UDI Carrier.
263

264 *Kits*

265 Kits are a collection of products, including medical devices, that are packaged together to
266 achieve a common intended use and is being distributed as a medical device. These could also be
267 called procedure packs or convenience kits.

268 Note: Jurisdictions may differ in their definition of kit.
269

270 *Label*

271 Written, printed, or graphic information either appearing on the medical device itself, or on the
272 packaging of each unit, or on the packaging of multiple devices [GHTF/SG1/N070:2011].

273

274 *Manufacturer*

275 Manufacturer means any natural or legal person¹ with responsibility for design and/or
276 manufacture of a medical device with the intention of making the medical device available for
277 use, under his name; whether or not such a medical device is designed and/or manufactured by
278 that person himself or on his behalf by another person(s) [GHTF SG1/N55:2009]. This includes
279 reproprocessors and remanufacturers that take responsibility for the device and reintroduce it into
280 commercial distribution.

281

282 *Own Brand/Private Labelers*

283 An Own Brand or Private Labeler relabels a device from a 3rd party with his own name without
284 making any further changes to the device thereby taking responsibility for it as the manufacturer.

285

286 *Packaging Levels*

287 Packaging levels means the various levels of device packages that contain a fixed quantity of
288 medical devices, e.g. each, carton, case. This does not include shipping containers such as pallets.

289

290 *Production Identifier (UDI-PI)*

291 The Production Identifier is a numeric or alphanumeric code that identifies the unit of device
292 production. The different types of Production Identifier(s) include serial number, lot/batch
293 number, manufacturing and/or expiration date.

294

295 *Radio Frequency Identification (RFID)*

296 RFID is a technology that uses communication through the use of radio waves to exchange data
297 between a reader and an electronic tag attached to an object, for the purpose of identification.

298

299 *Shipping containers*

300 Shipping container is a container where the traceability is controlled by a process specific to
301 logistics systems.

302

303 *Standalone medical device software*

304 Standalone Medical Device Software is software intended to be a medical device in its own right
305 and which is not embedded in another device.

306 Examples:

307 Radiation planning software, surgical planning software, cardiac patient management software,
308 picture archiving and communication systems (PACS).

309

310 *Unit of Use (UoU) UDI-DI*

¹ The term "person" that appears here includes legal entities such as a corporation, a partnership or an association.

311 The Unit of Use UDI-DI is an identifier assigned to an individual medical device when a UDI is
312 not labelled on the individual device at the level of its unit of use. Its purpose is to associate the
313 use of a device to/on a patient.

314

315 *UDI*

316 UDI means Unique Device Identification. The UDI is a series of numeric or alphanumeric
317 characters that is created through a globally accepted device identification and coding standard.
318 It allows the unambiguous identification of a specific medical device on the market. The UDI
319 comprises the UDI-DI and UDI-PI.

320 Note: The word "Unique" does not imply serialization of individual production units.

321

322 *UDI System*

323 The UDI System is the framework for the production of a UDI, its application on the label or
324 directly on device, and the storage of the UDI-DI and additional device related information in a
325 UDID.

326

327 *UDI Carrier*

328 The UDI Carrier is the means to convey the UDI by using Automatic Identification and Data
329 Capture (AIDC) and, if applicable, its human readable interpretation (HRI).

330 Note: Carriers can include linear bar-codes, 2D bar-codes and RFID, etc...

331

332 *UDI Database (UDID)*

333 The UDID contains identifying information and other elements associated with the specific
334 medical device.

335

336 **6. Guidance for a UDI System**

337

338 A UDI System comprises 3 parts:

339

- 340 1. the development of the UDI using globally accepted standards,
- 341 2. the application of that UDI on the label, and
- 342 3. the submission of appropriate information to a UDID.

343

344 In order to facilitate a globally harmonized approach to UDI, it is imperative that:

345

- 346 1. the marking of the UDI should be an additional requirement – it does not replace any other
347 marking or labeling requirements;
- 348 2. the manufacturer should create and maintain globally unique UDIs on his medical
349 devices;
- 350 3. the UDI on the device should not be changed, except in the cases of reprocessing,
351 remanufacturing, or relabeling that lead to a regulated new medical device;
- 352 4. only the manufacturer can establish the UDI on the device or its packaging. Reprocessors
353 of single use medical devices, remanufacturers, Own Brand/Private Labelers are considered
354 the manufacturer of the reprocessed or remanufactured device – and as such are also subject
355 to these requirements;

- 356 5. Manufacturer should provide UDI which can be readable at any user side and keep the
357 appropriate marking based on the quality management, such as clear readable label,
358 including uniqueness;
- 359 6. globally accepted coding standards managed by global organizations, such as GS1, HIBCC
360 and ICCBBA, meet the criteria of the UDI and manufacturers shall be permitted to choose
361 which system to use. These organizations have responsibility for maintaining the global
362 uniqueness of their coding systems. It is imperative that these coding systems be adopted
363 and implemented, without national deviations or changes to these global coding systems;
364 proliferation of coding systems must be discouraged;
- 365 7. national or regional regulatory requirements shall not restrict methods of AIDC as this will
366 hinder the establishment of a globally harmonized UDI System;
- 367 8. the National/Regional regulation for UDI System shall include a robust process for
368 evaluating and adjudicating applications for UDI exemptions that would exempt certain
369 device types or package levels (including direct part marking) from being labeled with UDI
370 or specific elements in the UDID;
- 371 9. common criteria for accreditation are:
- 372 a. The employed UDI must meet the requirements of the globally harmonized UDI
373 System to adequately identify a device through its distribution,
- 374 b. The employed UDI is in compliance with international standards ISO 15459-2,
375 ISO 15459-4 and ISO 15459-6,
- 376 c. The employed UDI will be available to all users according to a single set of
377 consistent fair and reasonable terms and conditions.
- 378

379 To meet the public health objectives of this guidance and to ensure that medical device user
380 facilities, healthcare providers, regulatory authorities, and others will be able to make efficient
381 and effective use of the UDI, there could be a need to limit the number of accredited global
382 organizations and available coding systems.

383

384 **7. The UDI**

- 385
- 386 1. A UDI shall be assigned to the device itself or its package. Higher levels of packaging shall
387 have their own UDI.
- 388 2. Shipping containers should be exempted. As an example, UDI is not required on a logistics
389 unit; when a healthcare provider orders multiple medical devices using the UDI or model
390 number of individual devices and the manufacturer places these devices in a container for
391 shipping or to protect the individually packaged devices, the container (logistics unit) is not
392 subject to UDI requirements.
- 393 3. The UDI contains two parts: a Device Identifier (UDI-DI) and a Production Identifier (UDI-
394 PI).
- 395 4. The UDI-DI (e.g., GS1 GTIN, HIBC-LIC, ISBT product code) should be globally unique at
396 all levels of packaging.
- 397 5. If a lot number, serial number, software version number or expiration date
398 appears on the label, they should be part of the UDI-PI. If there is ALSO a manufacturing
399 date on the label, it does NOT need to be included in the UDI-PI. If there is only a
400 manufacturing date on the label, this should be used as the UDI-PI.

- 401 6. When a UDI is not assigned to the device at the level of its unit of use, then a Unit of Use
402 (UoU) UDI-DI should be assigned, to associate the use of a device with a patient. [for
403 example, a UoU UDI-DI would be assigned to an individual electrode when the electrode is
404 distributed in a package of 10 – and lowest level UDI is assigned to that package of 10]
- 405 7. Each component, sub-system or accessory that is regulated as a
406 medical device needs a separate UDI.
- 407 8. Kits should have their own UDI.
- 408 9. The manufacturer assigns the UDI to a device following the relevant coding standard.
- 409 10. Any change of one of the following UDID data elements determines the need for a new
410 UDI-DI:
- 411 a. Brand Name,
 - 412 b. Device version/ model,
 - 413 c. Reference and/or catalogue number,
 - 414 d. Clinical Size (including Volume, Length, Gauge, Diameter),
 - 415 e. Labelled as single use,
 - 416 f. Packaged sterile,
 - 417 g. Need for sterilization before use.
- 418 11. At a minimum, a new UDI-DI is required whenever there is a change that could lead to
419 misidentification of the medical device and/or ambiguity in its traceability.
- 420 12. Reprocessors of single use medical devices, remanufacturers, Own Brand/Private Labelers
421 should create their own, new UDI for the reprocessed, remanufactured, or relabeled medical
422 device which will replace the OEM's UDI where it exists.
- 423 13. Reprocessors of single use medical devices, remanufacturers, Private (Own Brand) Labelers
424 shall retain record of the Original Equipment Manufacturer's (OEM) UDI.
- 425 14. A change of the label to display or modify a UDI-DI should not (in and of itself) require a
426 premarket submission and/or re-registration. Manufacturers may be requested to
427 notify/inform the Regulator.

428 **8. UDI Carrier**

- 429
- 430 1. The UDI Carrier (AIDC and HRI representation of the UDI) shall be on the label of the
431 device, its package, or on the device itself, and on all higher levels of packaging.
- 432 2. The UDI Carrier for low risk devices packaged and labeled individually does not need to be
433 on its package but rather on a higher level of packaging, e.g. carton. However, when the
434 healthcare provider is not expected to have access (e.g., home user) to the higher level of
435 packaging (e.g., carton), the UDI should be on its package.
- 436 3. Non-prescription medical devices exclusively for retail Point of Sale (POS) do not need to
437 encode Production Identifiers in AIDC on the point of sale package.
- 438 4. No particular AIDC methods should be required by a regulatory authority. Globally accepted
439 AIDC methods based on ISO standards that have been approved by the global organization
440 (e.g., GS1, HIBCC or ICCBBA) shall be used.
- 441 5. RFID should comply with open, commercially acceptable, industry standards such as EPC
442 (Electronic Product Code) and be vendor neutral.
- 443 6. When AIDC carriers other than the UDI Carrier are part of the product labeling, the UDI
444 Carrier shall be readily identifiable.

- 445 7. If linear bar codes are used, the UDI-DI and UDI-PI can be concatenated or non-
446 concatenated in two or more bar codes. All parts and elements of the linear bar code shall be
447 distinguishable and identifiable.
- 448 8. If there are significant constraints limiting the use of both AIDC and HRI on the label, the
449 AIDC format shall be favored. However, certain environments or use situations, such as
450 home care, may warrant the use of HRI over AIDC.
- 451 9. In case of RFID, a linear or 2D bar code shall also be provided on the label.
- 452 10. Medical devices that are reusable should have a UDI Carrier on the device itself.
- 453 a. The UDI Carrier of reusable medical devices that require reprocessing or
454 sterilization between patient uses should be permanent and readable after
455 reprocessing or sterilization cycles for the whole life of the device. Manufacturers
456 may determine that this may not be possible or warranted on some devices due to
457 size, design, materials, processing, or performance issues.
- 458 11. The UDI Carrier should be readable during normal use and throughout intended life of the
459 medical device.
- 460 12. If the UDI Carrier is readily readable through the medical device's package, then the UDI
461 Carrier does not also need to be on the package.
- 462 13. A single finished medical device made up of multiple parts that have to be assembled may
463 have the UDI Carrier only on one part.
- 464 14. The placement of the UDI Carrier should be done in a way that AIDC method can be
465 accessed during normal operation or storage.
466

467 **9. The UDID**

468 *9.1 General principles of the UDID*

- 469
- 470
- 471 1. No product commercial confidential information shall be included in the UDID.
- 472 2. The manufacturer is responsible for the initial submission and updates to the identifying
473 information and other medical device data elements in the UDID.
- 474 3. Appropriate methods/procedures for validation of the provided data shall be implemented.
- 475 4. The manufacturer shall periodically reconfirm all the data relevant to their medical devices,
476 except for discontinued medical devices.
- 477 5. The core data elements in the UDID shall be accessible to the public free of charge.
- 478 6. The presence of the medical device UDI-DI in the UDID does not mean that the medical
479 device is authorized in all jurisdictions.
- 480 7. The database should allow for the linking of all the packaging levels of the medical device.
- 481 8. Manufacturers should update the UDID within 30 days when a change is made to an element
482 that does NOT require a new UDI-DI.
- 483 9. The UDID shall use HL7 Structured Product Labeling (SPL) standard for data submission
484 and updates. Additional submission means could also be accommodated.
- 485 10. The core elements are the minimum elements needed to identify a medical device through
486 distribution and use. Regional or National UDID may contain additional elements; however,
487 these additional elements should be kept to a minimum.
- 488 11. The design of the UDID should support the official languages required in the jurisdictions
489 where the medical device is put on the market.
- 490 12. Data relating to discontinued medical devices shall be maintained in the UDID.

491 13. The UDID shall support the use of all the core UDID data elements.

492

493 *9.2 The core UDID data elements*

494

495 All the core UDID data elements are mandatory, unless marked optional. “If applicable” means
496 the information is mandatory to be in the UDID if it is on the label. Data elements and their
497 definitions for the UDID are listed below.

498

499 The core UDID data elements are the following:

500

501 1. For every packaging level – the following shall be provided in a related way (for entire
502 packaging hierarchy):

503 ü UDI-DI (UDI type, e.g. GS1 GTIN, HIBC-LIC, ISBT product code),

504 ü Quantity per package configuration: (e.g., each, 10 each, 5 shelf packs),

505 ü Additional device identifier(s) (if applicable) e.g. GS1, HIBC, or ISBT-128;

506 2. The Unit of Use UDI-DI (see section 7.6) code;

507 3. The data for new UDI-DI must be available at the time the medical device is put on the
508 market.

509 4. Manufacturer’s name (as required on the label);

510 5. Manufacturer’s address (as required on the label);

511 6. Manufacturer's customer service contact information (country specific, could be multiple);

512 7. Authorized Representative's name (regional representatives responsible for the medical
513 device) (country specific, could be multiple) (if required by the local/regional regulatory
514 authority) (see GHTF SG1 N55);

515 8. Authorized Representative's contact information (country specific, could be multiple);

516 9. Global Medical Device Nomenclature (GMDN) preferred code/term;

517 10. Brand Name (if applicable);

518 11. Device software major version (if applicable);

519 12. Reference and/or catalogue number (if applicable);

520 13. How the device is controlled: serial, lot/batch number, and/or expiration date (or
521 manufacturing date) or software version or software released date or ISBT-128 – check
522 boxes (if applicable);

523 14. Clinical Size (including Volume, Length, Gauge, Diameter) (if applicable) (e.g. 8F catheter);

524 15. Additional product Description (optional) – Additional clinically relevant information, e.g.
525 radio-opaque;

526 16. Storage conditions, as labeled on the product and/or in the IFU (if applicable) – to include
527 temperature range, needs to be refrigerated, relative humidity range, pressure range, avoid
528 direct sunlight;

529 17. Handling conditions (if different than storage conditions), as labeled on the product and/or in
530 the IFU (if applicable) – to include temperature range, needs to be refrigerated, relative
531 humidity range, pressure range, avoid direct sunlight;

532 18. Labeled as single use? (Yes/No);

533 19. Packaged sterile? (Yes/No);

534 20. Need for sterilization before use? (Yes/No) – *if yes, then the method of sterilization should be*
535 *indicated;*

536 21. Restricted number of reuses (if applicable);

- 537 22. License and/or marketing authorization or registration number (if required by the local
538 regulatory authority);
539 23. URL for additional information, e.g. electronic IFU (optional);
540 24. Critical warnings or contraindications (if applicable) – if a particular regulation requires that
541 the label of the device contains a critical warning or contraindication associated with the use
542 of the device [e.g.:
543 a) Labeled as containing latex? (Yes/No),
544 b) Labeled as containing DEHP? (Yes/No), etc...];
545 25. Discontinuance information (Information referring to products no longer placed on the
546 market – Date of discontinuance).
547

548 **10. Rules for specific device types**

549 *10.1 Implants*

550 Implants should follow the rules listed below:
551

- 552
- 553 1. All unit packs of implants (lowest level of packaging) need to be identified/AIDC marked
554 with an UDI (UDI-DI + UDI-PI);
 - 555 2. PI should have the following characteristics:
556 a. serial number for active implants,
557 b. serial number for other implants or lot number according to the manufacturer's
558 quality management system;
 - 559 3. The UDI of the implant must be identifiable prior to implantation.
560

561 *10.2 Reusable devices requiring sterilization or high level disinfection between uses*

562 These devices should follow the rules listed below:
563

- 564 1. The UDI of these products must be on the device and must be readable after each sterilization
565 or high level disinfection;
- 566 2. PI characteristics (e.g. lot or serial number) should be defined by the manufacturer according
567 to the manufacturer's quality management system;
568

569 *10.3 Non IVD kits*

- 570 1. The manufacturer of the Kit is responsible for identifying the Kit with a UDI including both
571 UDI-DI and UDI-PI;
572 a. Orthopedic procedure trays whose contents are configured for a specific order are
573 exempted from this UDI requirement.
574 Example: a hospital orders 30 different orthopedic devices for total joint replacement
575 surgery. The 30 devices are delivered to the hospital in a stainless steel box where the
576 devices can be stored and sterilized by the hospital when needed. After a procedure
577 the hospital may replace used parts and re-sterilize the box with its contents;
578
579
580
581

582 2. Medical device contents of Kits should have a UDI Carrier on their packaging or on the
583 device itself.

584
585

Exemptions:

586 a. Individual single-use disposable medical devices within a Kit, whose uses are
587 generally known to the persons by whom they are intended to be used, and which are
588 not intended for individual use outside the context of the Kit do not require their own
589 UDI Carrier.

590 Example: an unpackaged sterile syringe within a sterile Kit cannot be used for
591 another procedure due to the lack of a sterile barrier once removed from the Kit;

592 b. Medical devices that are normally exempted from having a UDI Carrier on the
593 relevant level of packaging do not need to have a UDI Carrier when placed within a
594 Kit.

595

596 3. Placement of the UDI Carrier on Kits:

597

598 a. The Kit UDI Carrier is generally affixed to the outside of the packaging;

599 b. The UDI must be readable or in the case of AIDC scan-able, whether placed on
600 the outside of Kit package or inside a transparent package.

601

602 *10.4 IVD Kits*

603

604 IVD kits should follow the rules listed below:

605

606 1. The manufacturer of the IVD Kit is responsible for identifying it with a UDI including both
607 UDI-DI and UDI-PI,

608

609 2. Medical device contents of IVD Kits should have a UDI Carrier on their packaging or on the
610 device itself,

611 a. The IVD Kit is a device and all aspects of this guidance that is relevant apply to it. If
612 an IVD Kit does not include any components which on their own are considered
613 medical devices the only UDI is the UDI of the kit itself;

614 b. Reagents used in automated systems bear barcodes necessary for their handling and
615 identification by the automated systems. This does not constitute a UDI;

616 c. Individual single-use disposable medical devices within an IVD Kit, whose uses are
617 generally known to the persons by whom they are intended to be used, and which are
618 not intended for individual use outside the context of the IVD Kit do not require their
619 own UDI Carrier;

620 d. Medical devices that are normally exempted from having a UDI Carrier on the
621 relevant level of packaging do not need to have a UDI Carrier when placed within an
622 IVD Kit.

623

624 3. Placement of UDI on IVD Kits:

625

626 a. The IVD Kit UDI is generally affixed to the outside of the packaging;

627 b. The UDI must be readable or in the case of AIDC scan able, whether placed on the
628 outside of the IVD Kit package or inside a transparent package.
629

630 *10.5 Configurable medical device systems*

631

632 For configurable medical device systems the rules listed below should be followed:

633

634 1. A UDI is allocated to the entire, configurable medical device system and is called the System
635 UDI.

636 2. The system UDI-DI is allocated to defined groups of configurations, not per configuration
637 within the group. A group of configurations is defined as the collection of possible
638 configurations for a given product line as described in a regulatory file.

639 3. A system UDI-PI is allocated to each individual system. A later change of a component, sub-
640 systems or accessory of the system does not change the UDI-PI of the system.

641 4. The carrier of the System UDI should be put on the assembly that most likely does not get
642 exchanged in its lifetime and should be identified as the System UDI.

643 5. Each component, sub-system or accessory that is considered a medical device and a
644 distributed or supplied unit needs a separate UDI;

645

646 *10.6 Standalone Medical Device Software*

647

648 **1. UDI Assignment Criteria**

649

650 The UDI should be assigned at the system level of the Standalone Medical Device Software.

651

652 The following changes would require a new UDI-DI for Standalone Medical Device Software:

653 1. Changes to the Model Number or Part Number of the Standalone Medical Device Software (not
654 revision);

655

656 2. Major Standalone Medical Device Software revisions shall be identified with a new UDI-DI;
657 – Major Standalone Medical Device Software revisions are meant as complex or significant
658 changes affecting the original performance and effectiveness, the efficacy of the safety or
659 the intended use of the Standalone Medical Device Software. These changes may include
660 new or modified algorithms, database structures, operating platform, architecture or new
661 user interfaces or new channels for interoperability.

662

663 3. Minor Standalone Medical Device Software revisions shall be identified with a new UDI-PI;
664 – Minor Standalone Medical Device Software revisions are generally associated with bug
665 fixes, aesthetics, usability enhancements, security patches or operating efficiency.

666 Note: Minor Standalone Medical Device Software revisions shall not require a new UDI-DI. Minor
667 revisions shall be identified by manufacturer-specific identification methods (e.g. version, revision
668 number, serial number, etc...)

669

670 4. The version number of the Standalone Medical Device Software is considered the manufacturing
671 control mechanism and should be displayed in the UDI-PI.

672

673

674 **2. UDI Placement Criteria**

- 675
676
677
678
679
680
681
682
683
684
685
686
687
688
689
690
691
692
693
694
695
696
- a. When the Standalone Medical Device Software is delivered on a physical medium, e.g. CD or DVD, each package level shall bear the human readable and AIDC representation of the complete UDI. The UDI that is applied to the physical medium containing the software and its packaging must be identical to the UDI assigned to the system level software.
 - b. UDI should be provided on a readily accessible screen by the user in an easily-readable plain-text format (e.g. an “about” file or included on the startup screen).
 - c. Software lacking a user interface (e.g. middleware for image conversion) must be capable of transmitting the UDI through an Application Programming Interface (API).
 - d. Only the human readable portion of the UDI is required in electronic displays of the Standalone Medical Device Software. The UDI AIDC marking needs not be used in the electronic displays, e.g. about menu, splash screen, etc...; i.e. software not being distributed by the use of physical data carriers (CDs, DVDs or similar) will not carry an AIDC.
 - e. The human readable format of the UDI for Standalone Medical Device Software should include the Application Identifiers (AI) for GS1, and Flag Characters for HIBCC, to assist the end user in identifying the UDI and determining which standard is being used to create the UDI.
